0033 1 |  DSR (Digital Standard RUNOFF) /DSRPLUS DSRINDEX/INDEX Utility
0034 1 |
0035 1 |ABSTRACT:
0036 1 |  The routines contained in this module sort and store
0037 1 |  index entries. This module is part of INDEX and was
0038 1 |  adopted from the TCX module XOUT.
0039 1 |
0040 1 |
0041 1 |ENVIRONMENT:  Transportable
0042 1 |
0043 1 |AUTHOR:      JPK
0044 1 |
0045 1 |MODIFIED BY:
0046 1 |
0047 1 |      007      JPK00018      09-Mar-1983
0048 1 |      Modified INDEX to handle new BRN format.
0049 1 |      Modified NDXOUT to handle specifiable levels on SORT= string.
0050 1 |      Modified NDXFMT to output new RUNOFF prologue.
0051 1 |      Modified NDXPAG to output new TMS prologue and RUNOFF epilogue.
0052 1 |
0053 1 |      006      JPK00015      04-Feb-1983
0054 1 |      Cleaned up module names, modified revision history to
0055 1 |      conform with established standards. Updated copyright dates.
0056 1 |
0057 1 |      005      JPK00012      24-Jan-1983
```

58	0058	1	!	Modified NDXVMSMSG.MSG to define error messages for both DSRINDEX and INDEX. Added require of NDXVMSREQ.R32 to NDXOUT, NDXFMT, NDXDAT, INDEX, NDXMSG, NDXXTN, NDXTMS, NDXVMS and NDXPAG for BLISS32. Since this file defines the error message literals, the EXTERNAL REFERENCES for the error message literals have been removed.
59	0059	1	!	
60	0060	1	!	
61	0061	1	!	
62	0062	1	!	
63	0063	1	!	004 JPK00010 24-Jan-1983 Removed routines GETDAT and UPDDAT from NDXDAT - they performed no useful function. Removed references to these routines from NDXOUT, NDXFMT, and NDXMSG. Removed reference to XPOOL in NDXOUT - not used.
64	0064	1	!	
65	0065	1	!	
66	0066	1	!	
67	0067	1	!	
68	0068	1	!	003 JPK00009 24-Jan-1983 Modified to enhance performance. The sort buckets have each been divided into 27 sub-buckets; 1 for each letter and 1 for non-alphas. Removed reference to BUCKET from INDEX. Definition of the structure was added to NDXPOL. References to BUCKET were changed in modules NDXOUT, NDXINI, NDXFMT and NDXDAT.
69	0069	1	!	
70	0070	1	!	
71	0071	1	!	
72	0072	1	!	
73	0073	1	!	002 JPK00004 24-Sep-1982 Modified NDXOUT, NDXMSG, NDXFMT, and NDXDAT for TOPS-20. Strings stored in the index pool use the first fullword for their length. References to these strings were incorrect.

```
CREATION DATE: January 1982
```

```
MODIFIED BY:
```

```
004      JPK00015      04-Feb-1983
          Cleaned up module names, modified revision history to
          conform with established standards. Updated copyright dates.
```

```
003      JPK00011      24-Jan-1983
          Changed CMDBLK [NDX$G_LEVEL] to CMDBLK [NDX$H_LEVEL]
          Changed CMDBLK [NDX$H_FORMAT] to CMDBLK [NDX$H_LAYOUT]
          Changed CMDBLK [NDX$V-TMS11] and CMDBLK [NDX$V-TEX] to CMDBLK [NDX$H_FORMAT]
          Changed comparisons of (.CHRS12 EQLA CHRS2A) to
          (.CMDBLK [NDX$H_FORMAT] EQL TMS11 A).
          Definitions were changed in NDXCLI and references to the
          effected fields were changed in NDXPAG, NDXFMT, INDEX, NDXVMS
          and NDXCLIDMP.
```

```
002      RER00002      20-Jan-1983
          Modified VMS command line interface module NDXVMS:
          - changed /FORMAT qualifier to /LAYOUT.
```

- changed use of /RESERVE and /REQUIRE for DSRPLUS.
- added code for new DSRPLUS qualifiers /FORMAT and
/TELLTALE HEADINGS.
Added fields to NDXCLI for new qualifiers: NDXSV_TELLTALE
and NDXSV_TEX.
Conditionalized output of NDXSV_PAGE_MERGE in NDXCLIDMP to
account for different DSR and DSRPLUS default values.

FACILITY:
DSR (Digital Standard RUNOFF) /DSRPLUS DSRINDEX/INDEX Utility

ABSTRACT:
This file contains literals and macros defining the data structures
found in the internal index pool

ENVIRONMENT: Transportable

AUTHOR: JPK

CREATION DATE: January 1982

MODIFIED BY:

003 JPK00015 04-Feb-1983
Cleaned up module names, modified revision history to
conform with established standards. Updated copyright dates.

002 JPK00009 24-Jan-1983
Modified to enhance performance. The sort buckets have each
been divided into 27 sub-buckets; 1 for each letter and 1
for non-alphas. Removed reference to BUCKET from INDEX.
Definition of the structure was added to NDXPOL. References
to BUCKET were changed in modules NDXOUT, NDXINI, NDXFMT
and NDXDAT.

! Structure definition for bucket array.

Buckets are arranged so that each row represents the first letter of
the string and each column represents the second letter of the string.This approach is used only for master indexes as no performance
improvement is realised until about 10 input files have been processed.Indexes which are not master indexes use only the first element of
each row, i.e., [0, 0] ... [26, 0].The only exception is for nonalphabetic characters which use only
element [0, 0]. Elements [0, 1] ... [0, 26] are not used since mapping
all nonalphabetic into one row loses the sort order of the first
character in the string. For nonalphabetic to work correctly in a two
dimensional bucket scheme, the array would have to be at least 127 x 127

	0	1		26
0	**	not used	:	.
1	A?	AA	:	AZ
:			:	:
26	Z?	ZA	.	ZZ

STRUCTURE

\$BUCKET_ARRAY [ROW_IDX, COL_IDX; M, N] =
[M * N * %UPVAL] (\$BUCKET_ARRAY + (ROW_IDX * N + COL_IDX) * %UPVAL);

FACILITY:
DSR (Digital Standard RUNOFF) /DSRPLUS DSRINDEX/INDEX Utility

ABSTRACT:
This file contains external references to the error message numbers
for DSRINDEX/INDEX.

New messages must be defined in NDXVMSMSG.MSG and referenced here:
both in the MACRO section (for DSRINDEX) and the EXTERNAL LITERAL
section (for INDEX)

ENVIRONMENT: VAX/VMS User Mode

AUTHOR: JPK

CREATION DATE: 01-Feb-1983

MODIFIED BY:

004 JPK00022 30-Mar-1983
Modified NDXVMS, NDXFMT, NDXPAG, NDXVMSMSG and NDXVMSREQ
to generate TEX output. Added module NDXTEX.

003 JPK00021 28-Mar-1983
Modified NDXT20 to include E2.0 functionality.
Modified NDXCLIDMP, NDXFMT, NDXPAG, NDXVRS to require RNODEF
for BLISS36 and to remove any conditional require based on
DSRPLUS_DEF.

FACILITY: DSR (Digital Standard RUNOFF) / DSRPLUS

ABSTRACT:
Converts BLISS/VARIANT values into useful names.

ENVIRONMENT: Transportable BLISS

AUTHOR: Rich Friday

CREATION DATE: 1978

MODIFIED BY:

016 KAD00016 Ray Marshall 19-Mar-1984
Added GERMAN, FRENCH, & ITALIAN.

015 KAD00015 Keith Dawson 18-Apr-1983
Made the LN01 conditional the default for vanilla DSR --
its value is 0 (no variant supplied).

014 KAD00014 Keith Dawson 22-Mar-1983
Asserted the LN01 conditional when DSRPLUS is asserted.

013 KAD00013 Keith Dawson 20-Mar-1983
Removed all references to .BIX and .BTC files.

012 KAD00012 Keith Dawson 07-Mar-1983
Global edit of all modules. Updated module names, idents,
copyright dates. Changed require files to BLISS library.

--

      This variable (LN01) controls whether or not to compile an LN01-flavored
      DSR. It is asserted by default, and also whenever DSRPLUS is asserted.

      Modules utilizing LN01 are:

      DOOPTS  NOUT

COMPILETIME
  ln01 =
    ( (%VARIANT EQL 0) OR %VARIANT/2 )
  ;

      This variable (DSRPLUS) controls compilation for the DSRPLUS program.

      All modules utilize DSRPLUS.

COMPILETIME
  dsrplus =
    ( %VARIANT/2 )
  ;

      This variable (FLIP) controls compilation of FLIP features of DSRPLUS.
      It assures that FLIP features are compiled only on VMS systems.

      Modules utilizing FLIP are many and various.

COMPILETIME
  flip =

XSBTTL 'XOUT -- Put away index item'

GLOBAL ROUTINE XOUT (ENTRY_LENGTH, ENTRY_PTR, XTN, BAR_FLAG) : NOVALUE =

+
FUNCTIONAL DESCRIPTION:
    Place an index or sub-index item into the index master storage
    list in alphabetical order.

FORMAL PARAMETERS:
    ENTRY_LENGTH - Length of index entry text
    ENTRY_PTR    - CH$PTR to index entry text
    XTN          - Transaction number
    BAR_FLAG     - Change bar flag

IMPLICIT INPUTS:
    CMDBLK - Command line information block
    XPLBLK - Extended indexing attributes block
    CELL   - Information about current position in list

IMPLICIT OUTPUTS:
    None

ROUTINE VALUE:
COMPLETION CODES:
    NONE

SIDE EFFECTS:
    Master index is built.

--

```
359 1161 1 %SBTTL 'SORT_AS -- Build sort string'
360 1162 1 ROUTINE SORT_AS (I_PTR, I_LEN, LEVEL) : NOVALUE =
361 1163 1 ++
362 1164 1
363 1165 1 FUNCTIONAL DESCRIPTION:
364 1166 1
365 1167 1     This routine builds the sort string used to position the index
366 1168 1     entry in the index.
367 1169 1
368 1170 1     If the user specified a sort string then that string is used.
369 1171 1
370 1172 1     If /SORT=LETTER was specified on the command line, a sort string
371 1173 1     is built from the input string.
372 1174 1
373 1175 1     If /SORT=NONALPHA=IGNORE was specified on the command line, a
374 1176 1     sort string is built if the first character in the input string
375 1177 1     is not alphabetic.
376 1178 1
377 1179 1     Otherwise no string is built and the entry is positioned
378 1180 1     according to the text of the entry.
379 1181 1
380 1182 1 FORMAL PARAMETERS:
381 1183 1
382 1184 1     I_LEN   - Length of input string
383 1185 1     I_PTR   - Pointer to input string
384 1186 1     LEVEL   - Subindex level
385 1187 1
386 1188 1 IMPLICIT INPUTS:
387 1189 1
388 1190 1     XPLBLK   - Extended index attributes block
389 1191 1     CMDBLK   - Command line information block
390 1192 1     USER_SORT_LEN - Length of user specified sort string if any
391 1193 1     USER_SORT_PTR - Pointer to user specified sort string if any
392 1194 1
393 1195 1 IMPLICIT OUTPUTS:
394 1196 1
395 1197 1     USER_SORT_LEN - Length of remainder of user specified sort string if any
396 1198 1     USER_SORT_PTR - Pointer to remainder of user specified sort string if any
397 1199 1     SORT_PTR     - Points to the sort string if any
398 1200 1     SORT_LEN     - Is the length of the sort string
399 1201 1

942 1741 1 FUNCTIONAL DESCRIPTION:
943 1742 1
944 1743 1     Insert an index item into the index list.
945 1744 1
946 1745 1 FORMAL PARAMETERS:
947 1746 1
948 1747 1     STRING - CH$PTR to the string associated with the item.
949 1748 1             (zero is allowed).
950 1749 1     LENGTH - Length of the passed string.
951 1750 1     SUB_CNT - Sub-index level of item (0 to n)
952 1751 1     XTN - Transaction number of the page associated with this
953 1752 1           index item.
954 1753 1     BAR - Change bar flag
955 1754 1     ENT_LEN - Length of whole index entry
956 1755 1     ENT_PTR - CH$PTR to whole index entry string
957 1756 1
958 1757 1 IMPLICIT INPUTS:
959 1758 1
960 1759 1     CELL - Information table about current position in list.
961 1760 1     BOOKID - Master index book ident string address
962 1761 1     SORT_LEN - Length of sort string if any
963 1762 1     SORT_PTR - Pointer to sort string if any
964 1763 1

1392 2189 1 %SBTTL 'ENTRY_CMP -- Compare new entry with current entry'
1393 2190 1 ROUTINE ENTRY_CMP (NEW_PTR, NEW_LEN, LAST, XTN, LEVEL) =
1394 2191 1 ++
1395 2192 1
1396 2193 1 FUNCTIONAL DESCRIPTION:
1397 2194 1
1398 2195 1     This routine compares the new entry with the current entry.
1399 2196 1
1400 2197 1     For subindex entries (i.e. LEVEL NEQ 0) performs the following checks:
1401 2198 1
1402 2199 1         If LAST is TRUE, checks to see if new entry is either
1403 2200 1         a .ENTRY or .YPLUS.
1404 2201 1
1405 2202 1         If the new entry is a .Y or .YP, it checks to see if the
1406 2203 1         current entry is either a .X (.XP) or if the current entry
1407 2204 1         has subentries. If so, a value of TRUE is returned indicating
1408 2205 1         that the new entry should be inserted before the current entry.
1409 2206 1
1410 2207 1         If LAST is FALSE or the new entry is not a .Y (.YP) and the
1411 2208 1         current entry is a .Y (.YP), a value of FALSE is returned
1412 2209 1         indicating that the new entry should be inserted after the
1413 2210 1         current entry.
1414 2211 1
1415 2212 1         Otherwise, calls STRG_CMP to see if the new entry should be
1416 2213 1         inserted here. If so, calls STRG_CMP again to see if the
1417 2214 1         new entry is identical to the current entry.
1418 2215 1
1419 2216 1 FORMAL PARAMETERS:
1420 2217 1
1421 2218 1     NEW_PTR - Pointer to new entry text
1422 2219 1     NEW_LEN - Length of new entry
1423 2220 1     LAST    - TRUE if XTN should be compared to transaction number
1424 2221 1               associated with CELL.
1425 2222 1     XTN     - Transaction number of new entry if LAST is TRUE
1426 2223 1     LEVEL   - Subindex level (0 to n)
1427 2224 1
1428 2225 1 IMPLICIT INPUTS:
1429 2226 1
1430 2227 1     CELL    - contains pointers to the list item for comparison.
1431 2228 1     SORT_LEN- Length of sort string if any
1432 2229 1     SORT_PTR- pointer to sort string if any
1433 2230 1
1434 2231 1 IMPLICIT OUTPUTS:

1566 2362 1 %SBTTL 'STRG_CMP -- Compare two strings'
1567 2363 1
1568 2364 1 ROUTINE STRG_CMP (S1_LEN, S1_PTR, S2_LEN, S2_PTR) =
1569 2365 1
1570 2366 1 ++
1571 2367 1 FUNCTIONAL DESCRIPTION:
1572 2368 1
1573 2369 1     This routine is called to compare two strings.
1574 2370 1     It returns TRUE if string 1 should be before string 2.
1575 2371 1
1576 2372 1     It sets CELL [CSV_IDNS] if the strings are identical.
1577 2373 1
1578 2374 1 FORMAL PARAMETERS:
1579 2375 1
1580 2376 1     S1_LEN - Length of string 1
1581 2377 1     S1_PTR - Pointer to string 1
1582 2378 1     S2_LEN - Length of string 2
1583 2379 1     S2_PTR - Pointer to string 2
1584 2380 1
1585 2381 1 IMPLICIT INPUTS:
1586 2382 1
1587 2383 1     NONE
1588 2384 1
1589 2385 1 IMPLICIT OUTPUTS:
1590 2386 1
1591 2387 1     CELL [CSV_IDNS] - set to true if strings are identical
1592 2388 1
1593 2389 1 ROUTINE VALUE:
1594 2390 1 COMPLETION CODES:
1595 2391 1
1596 2392 1     TRUE    - String 1 is before string 2
1597 2393 1     FALSE   - Otherwise

```
: 1723 2518 1 %SBTTL 'CHRCMP -- Compare two characters in internal format'
: 1724 2519 1
: 1725 2520 1 ROUTINE CHRCMP (XA, XB, CASECMP, CHARCMP, EMPHCMP, REMAINDER_A, REMAINDER_B) : NOVALUE =
: 1726 2521 1
: 1727 2522 1 ++
: 1728 2523 1 FUNCTIONAL DESCRIPTION:
: 1729 2524 1
: 1730 2525 1 CHRCMP compares two characters in RUNOFF internal format (i.e.,
: 1731 2526 1 as generated by SCANT).
: 1732 2527 1
: 1733 2528 1 Basically, the comparison is done lexically, with the change
: 1734 2529 1 that the characters which are not letters are lexically smaller
: 1735 2530 1 than any letters.
: 1736 2531 1
: 1737 2532 1 It takes overstriking, underlining, and bolding into account
: 1738 2533 1 when doing the comparison. If two characters are identical
: 1739 2534 1 except for their emphasis, the comparison is such that the
: 1740 2535 1 character with the most emphasis is lexically smallest.
: 1741 2536 1
: 1742 2537 1 Bolding is considered to emphasize more than underlining, but
: 1743 2538 1 less than both underlining and bolding together. Underlining
: 1744 2539 1 emphasizes more than overstriking; but note that the
: 1745 2540 1 overstriking sequence is NOT taken into account in the
: 1746 2541 1 comparison. Upper case emphasizes more than lower case. Emphasis
: 1747 2542 1 is always less significant than "naked character" differences.
: 1748 2543 1
: 1749 2544 1 FORMAL PARAMETERS:
: 1750 2545 1
: 1751 2546 1 XA and XB are CH$PTRs to the characters to be compared.
: 1752 2547 1
: 1753 2548 1 CHARCMP - Returned as if computed by subtracting the internal
: 1754 2549 1 representations of the characters, except that letters
: 1755 2550 1 are "greater" than all other characters.
: 1756 2551 1
: 1757 2552 1 CASECMP - Returned as if computed by subtracting the
: 1758 2553 1 "upper/lower caseness" of the characters. Upper case
: 1759 2554 1 has "value" 0, lower case 1.
: 1760 2555 1 By definition, characters other than letters are in upper case.
: 1761 2556 1
: 1762 2557 1 EMPHCMP - Returned as SIGN(emphasis of A - emphasis of B) where
: 1763 2558 1 each emphasis type requires one bit. Overstriking has
: 1764 2559 1 the value 1, underlining has the value 2 and bolding
: 1765 2560 1 the value 4.
: 1766 2561 1
: 1767 2562 1 REMAINDER_A - the number of characters scanned in XA is subtracted from it.
: 1768 2563 1 REMAINDER_B - the number of characters scanned in XB is subtracted from it.
: 1769 2564 1
: 1770 2565 1 IMPLICIT INPUTS:
: 1771 2566 1
: 1772 2567 1 The arrangement of the internal representation is implicit
: 1773 2568 1 in the algorithm. Basically it assumes that the "naked"
: 1774 2569 1 character comes after the escape (=emphasis) sequences.
: 1775 2570 1
: 1776 2571 1 IMPLICIT OUTPUTS:
: 1777 2572 1
: 1778 2573 1 NONE
: 1779 2574 1
```

```
1780 2575 1 ROUTINE VALUE:
1781 2576 1
1782 2577 1 The result is returned as if it could be computed by
1783 2578 1 SIGN (.A - .B);
